<http://www.fim.uni-linz.ac.at/staff/sonntag.htm>

# Agenda

- Recycle bin
- Print spool files
- Thumbs.db
- Prefetch
- Swap/Hibernation file
- The Windows Registry
  - Recent files
  - USB device history
  - Registry traces
  - Various elements
- Restore points

# Windows forensic: Recycle bin

- When deleting files normally, they end up in the recycler
  - Shift+DEL → Deleted immediately
    - » Special tools/file carving!
  - Something in the recycler → Generally deleted intentionally
    - » These files are completely recoverable: Name, content etc.
- Emptying the recycle bin:
  - The saved files are actually deleted; just like normal files
    - » Their directory entries within the recycler folder remain
    - » Their data remains on the disk until overwritten
  - The INFO2 file (see later) is deleted and a new one created
    - » Sometimes only shortened, i.e. the record numbers continue
- Deleting a single file from the recycle bin
  - Changes the first byte of the record in INFO2 file to '00'
    - » Typically drive letter; recreatable from drive number in record!
- Note: Removable media does **not** have a recycle bin!

# Windows forensic: Recycle bin

- Physical changes on deleting "into" the recycler:
  - File entry deleted from original directory
    - » Remains there until overwritten!
  - Modified/Last Access updated
  - The long filename is deleted
  - File entry created in recycler directory
    - » D<original drive letter><#>.<original extension>
      - Dc1.txt: Second deleted file from drive C, had "txt" extension
      - Note: In the Windows Explorer you always see only your own files and the filenames from the INFO file!
    - » Subdirectory: User-SID
  - Information added to recycler index file ("INFO"/"INFO2" file)
    - » Includes deletion time, original location, recycle bin index
      - Index allows discovery of deletion order!
    - » Attention: Windows Vista has replaced the INFO file with a separate file named similar as the one with the deleted data!

# Windows forensic: Recycle bin

- The INFO2 file structure
  - Binary file
  - Contains the file name twice: ASCII and Unicode
  - 20 Byte file header; Bytes 12-13 (-15?) are record size
    - » Record size is usually 2003 = 0x0320 = 800 Bytes
- Record structure
  - 260 Bytes: Original file name (ASCII), including path
  - 4 Bytes: Record number (starting at 0)
  - 4 Bytes: Drive number (00 = A, 01 = B, 02 = C, ...)
  - 8 Bytes: Deletion time (FILETIME format, UTC)
  - 4 Bytes: Physical file size (=Bytes on disk!)
    - » Therefore always multiples of cluster size
    - » Actual file size: See directory entry of the file itself
  - 520 Bytes: Original file name (Unicode), including path

# Windows forensic: Recycle bin

- Original filename:  
C:\Documents and Settings\SONNTAG.ADS-FIM\Desktop\EURO Calculator & Info.URL
- Record number: 1 ☐
- Drive number: 2 (= C: ) ☐
- Deletion time: ☐  
0063E71E:D605C801  
(=1EE76300:01C805D6,  
=3.10.2007 15:57:37 UTC)
- Physical file size: ☐  
0x00100000 (=0x00001000,  
= 4096 Bytes)

# Windows forensic: Vista/7 - Recycle bin

- The directory is similar, but organisation within is different
  - Each file is stored directly with a new filename:
    - » \$R<six random characters>.<original extension>
  - Information on “real” filename (and additional data):
    - » \$I<six random characters>.<original extension>

- Additional data stored:

- » File length: 544 Bytes
- Magic number ☐
- Original file size ☐
  - » Byte order is reversed!
- Date and time of deletion ☐
  - » Windows 64 Bit hex value Little endian
- Original file name ☐
  - » 520 Bytes = 260 characters
  - Max. path length!

# Print spool files

- When printing documents, these are not immediately sent to the printer, but rather stored in a local file
  - This is then sent to the printer
    - » And deleted after successful completion
  - Attention: Users can configure within the printer properties that the data is sent immediately to the printer; this is rare!
  - Note: This applies to **local** printers **only!**
    - » Network printers will have this file created on the **print server**
- Typical file formats for spooling are:
  - RAW: Directly as the printer wants it, e.g. Postscript or some proprietary format
    - » Device dependent
    - » Can be re-printed simply by sending to a (similar!) printer again
  - EMF: Enhanced Metafile Format (32 Bit version of WMF)
    - » Device independent
    - » Viewer programs available

# Print spool files

- For each print job two files are created
  - SHD: Job metadata (owner, printer, print method, ...)
  - SPL: Job data (RAW or EMF)
- Contents of the SHD file:
  - Username, Name of user to notify
  - Document name
  - Printing time
    - » SYSTEMTIME structure (=UTC!)
  - Page count
  - Windows version
  - Job ID
  - Priority
  - Printer name + driver + mode
  - Printing processor + format
  - Computer name

- Thumbs.db: Hidden file to store thumbnail images (previews) of the files in a folder
  - But **ONLY**, if the folder was viewed in "Thumbnail view" at **SOME** time in the past when the file was already there
  - Can be deactivated (Default: enabled) in Explorer properties
    - » "Do not cache thumbnails"
  - Deleting images from the disk will **not** remove the thumbnail from Thumbs.db!
    - » They will **never** be removed!
    - **Only** solution: Delete Thumbs.db file!
- File format: OLE2 Compound Document (MS Office)
- What is stored: JPEG, BMP, GIF, HTM
- Encrypted files will still have an **unencrypted** thumbnail!
  - » If viewed in thumbnail view when they were not yet encrypted ...
  - However, this security flaw was fixed at some time somehow

- Attention:
  - Windows Vista does no longer have this file
  - Win2K+NTFS: Thumbnails in ADS (FAT → Thumbs.db!)
- Before Windows XP: Contained also drive letter and path
  - Windows ME, Win2K
- Take care when copying directories to a USB stick:
  - When copying the directory, the Thumbs.db file is copied too
  - When copying all files, it is not copied (unless shown anyway)
- Thumbs.db can be used to prove that images actually were on a certain computer: The Thumbs.db file is still there, and the files (including the same Thumbs.db) have been found somewhere else!

## Thumbnails >=Vista

- Creates thumbnails for files on different media types
  - Including removable and network drives
  - Including files in encrypted containers, e.g. TrueCrypt
  - But NOT for files encrypted with EFS, unless the thumbcache directory is also encrypted!
    - » Vista: Thumbnails are not deleted if encrypted by EFS later
- Central cache for all directories per user in his folder
  - %USERPROFILE%\AppData\Local\Microsoft\Windows\Explorer
- Contains several files:
  - Thumbcache\_32{96,256,1024}.db
    - » Individual thumbnails in the various sizes (32-1024 pixel)
  - Thumbcache\_idx.db: Central index for thumbnails
    - » Required for finding the image in the cache files
  - Thumbcache\_sr.db: Unknown; constant content
- Win 7: Last-modified field for each thumbnail removed

# Windows prefetch

- Frequently (or recently) used applications are logged in a special folder: Speed up their start by noting which sectors from the disk will be required directly upon start
  - These are then swapped in immediately, even if not at the start of the executable file
- Stored in directory "C:\Windows\Prefetch"
  - Naming: <Executable file name>-XXXXXXXXX.pf
    - » XXXXXX: Hash of location from where it was run
  - Count of executing the program:  
HKCU\Software\Microsoft\Windows\CurrentVersion\Explorer\UserAssist\{GUID}\Count
    - » ROT-13 encoded!
    - » "Data": 5th byte -5 = Count of execution
  - Maximum count (XP): 128 entries
  - Contains also references to loaded modules

# Windows prefetch

- When is it updated?
  - XP: Boot time and application launch, 2003: Boot time (def.)
- Attention: Prefetch is system-wide
  - You cannot tell from the file which user executed it
    - » But with MAC time this can be possible (if you know who was logged on at which time)
    - » See also the UserAssist registry entries (previous slide; HKCU!)
- Note the MAC times of the files:
  - Created: Program was started for the first time
  - Modified: Program was started for the "last" time
    - » Attention: Will not be updated after some time (probably when windows decides it exactly knows what to do)
- .pf file content
  - Timestamp: FILETIME at offset 0x78
  - Run count: DWORD at offset 0x90

Disabling prefetch: <http://msdn2.microsoft.com/en-us/library/ms940847.aspx>

# Swap/Paging file

- Contains pages from the memory
  - Not necessarily in a "good" order!
  - Data may remain there for a very long time as well
    - » If this sector happens to not being used
- Attention: Normal shutdown may delete, truncate, overwrite etc. the swap file!
  - In important cases it is therefore necessary (after doing live analysis) to pull the plug, but not shutdown the system!
- Hidden file, C:\pagefile.sys
- Typical application for file carving: Assembling a file from numerous smaller parts
  - Very difficult and unreliable, unless complete and in correct order (this is likely only for very small files)!
- Practical usage: Search for strings

# Swap/Paging file

- Attention: Anything found in there is "suspect!"
  - You don't know when this information was put in there
  - You don't know which user was logged in at that time
  - The data may have already been on the disk when the paging file was created
- The swap file need not be located in contiguous sectors
  - There may be small "holes", which perhaps are not reused for a long time because they are so small
    - » Good location for finding "old" file fragments

# Hibernation file

- Similar to the swap file: Contains memory pages
  - But here it is a complete image of the total memory!
  - May be smaller or larger than the swap file
- Can be used to recreate the last point in time
  - Virtual machines come in handy for this
- Hidden file: C:\Hiberfil.sys
- Attention: The first block will always be overwritten with zeros after boot, so **never** wake up a hibernated computer without obtaining a forensic copy before!
  - Rest of the file remains unchanged until the next hibernation!
  - So the state at a previous point in time may be recreated
- The hibernation file is compressed

# The Windows Registry

- The Registry is similar to a file system:
  - Hierarchical storage of data
  - Keys = Directories
  - Values = Files
    - » Name, Data and Type (BINARY, DWORD, SZ, MULTI\_SZ, EXPAND\_SZ)
- 5 root keys exist:
  - HKLM: HKEY\_LOCAL\_MACHINE (Computer-specific data)
  - HKU: HKEY\_USERS (User-specific data)
  - HKCR: HKEY\_CLASSES\_ROOT (application settings, file associations, class registrations for COM objects)
    - » Link to HKLM\Software\Classes
  - HKCC: HKEY\_CURRENT\_CONFIG (Current hardware conf.)
    - » Link to HKLM\System\CurrentControlSet\Hardware Profiles\Current
  - HKCU: HKEY\_CURRENT\_USER (Current user's data)
    - » Link to HKU\<SID of current user>

- AutoRun Programs

- Long list of locations in registry, e.g.

- » HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Run  
– /RunOnce

- » HKLM\SOFTWARE\Wow6432Node\Microsoft\Windows\CurrentVersion\Run bzw. \RunOnce

- » Same under HKCU!

- » Explorer hooks, like HKLM and  
HKCU\Software\Classes\*\SehIEx\ContextMenuHandlers

- » Print monitors: HKLM\SYSTEM\CurrentControlSet\Print\Monitors

- » Winlogon notifications

- Long list of locations outside the registry, e.g.

- » “Startup” folder in start menu of user profile

- » Scheduled tasks

- Useful tool: AutoRuns from Microsoft

# The Windows Registry

- The Registry is similar to a file system:
  - Hierarchical storage of data
  - Keys = Directories
  - Values = Files
    - » Name, Data and Type (BINARY, DWORD, SZ, MULTI\_SZ, EXPAND\_SZ)
- 5 root keys exist:
  - HKLM: HKEY\_LOCAL\_MACHINE (Computer-specific data)
  - HKU: HKEY\_USERS (User-specific data)
  - HKCR: HKEY\_CLASSES\_ROOT (application settings, file associations, class registrations for COM objects)
    - » Link to HKLM\Software\Classes
  - HKCC: HKEY\_CURRENT\_CONFIG (Current hardware conf.)
    - » Link to HKLM\System\CurrentControlSet\Hardware Profiles\Current
  - HKCU: HKEY\_CURRENT\_USER (Current user's data)
    - » Link to HKU\<SID of current user>

# Physical storage of the registry

- The Registry is logically a "single file"
  - But parts are stored in different files or created dynamically
- File locations:
  - HKLM\SAM %SYSTEMROOT%\System32\config\SAM
  - HKLM\Security %SYSTEMROOT%\System32\config\SECURITY
  - HKLM\Software %SYSTEMROOT%\System32\config\software
  - HKLM\System %SYSTEMROOT%\System32\config\system
  - HKLM\Hardware Stored in memory only – not on disk!
  - HKU\.Default %SYSTEMROOT%\System32\config\default
  - HKU\SID %USERPROFILE%\NTUSER.DAT
  - HKU\SID\_Classes %USERPROFILE%\Local Settings\ Application Data\Microsoft\Windows\UsrClass.dat

## User/... identifiers: SID

- SID = Security Identifier

- S-1-0-0 (Nobody): A group with no members
- S-1-1-0 (Everyone): A group that includes all users
- S-1-2-0 (Local): Users who logged on locally
- S-1-2-1 (Console Logon): Users on the phys. console
- S-1-3-0 (Creator Owner): The user who created a new object
- S-1-3-1 (Creator Group): The primary group of the user who created a new object
- S-1-5-2 (Logon Network): Users logging on via network
- S-1-5-7 (Anonymous): Anonymous logged on users
- S-1-5-18 (Local System): The OS itself
- S-1-5-19 (Local Service): Service account
- S-1-5-20 (Network Service): Service account
- S-1-5-21-?????-500: Domain administrator
- S-1-5-32-544 (Administrators): Group of all administrators

Installation dependent  
(unique!)

# Installed software

- Software might be installed, although not visible as an icon on the desktop or in any start menu
  - Registry keys are usually created during installation, but not always removed (although they should be) when the program is uninstalled
    - » HKLM\SOFTWARE\Microsoft\Windows\C.V.\App Paths
    - » HKLM\SOFTWARE\Microsoft\Windows\C.V.\Uninstall
  - Separate registry keys for application settings might exist too
- Verification:
  - Check for the actual executable at the contained path
  - Check timestamp on registry key
- Cross-verification: Search for all executable files
  - Note: Will not work for all kinds of plugins!

# Windows forensic: Recent files MRU lists (Most Recently Used)

- These are usually stored within the registry
  - Old windows versions: INI-files in windows/program directory
- Common lists include:
  - Start menu: HKCU  
Software\Microsoft\Windows\CurrentVersion\Explorer\RecentDocs
    - » Equivalent of %USERPROFILE%\Recent  
="My Recent Documents"
    - » Includes both local and network files!
  - Run box: HKCU  
Software\Microsoft\Windows\CurrentVersion\Explorer\RunMRU
    - » In order of most recently added (not: Used!)
  - Files (Common dialog box): HKCU\Software  
Microsoft\Windows\CurrentVersion\Explorer\ComDlg32\OpenSaveMRU  
Microsoft\Windows\CurrentVersion\Explorer\ComDlg32\LastVisitedMRU
  - Typed URLs in IE: HKCU  
Software\Microsoft\InternetExplorer\TypedURLs

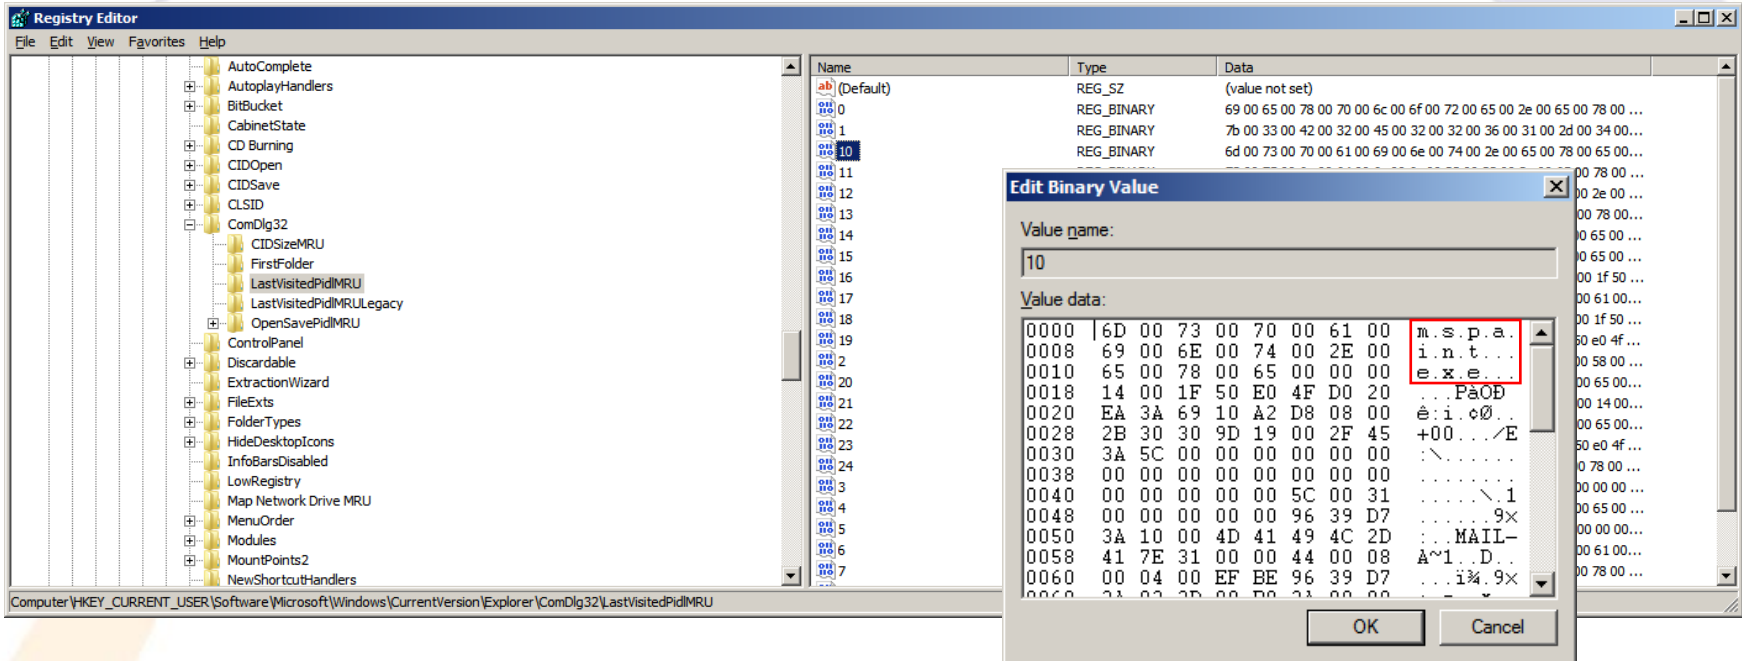

# Windows forensic: Recent files MRU lists (Most Recently Used)

- Windows default search: HKCU  
Software\Microsoft\SearchAssistant\ACMrul
  - » Subkey "5603": Search terms for folders and filenames
  - » Subkey "5604": Search terms for words/phrases within files
- Note: MRU list locations depend heavily on the
  - Windows version
  - Software version
  - Installed patches
  - Program configuration!
  - Use software on a copy of the evidence when using the program to identify the registry keys modified
    - » E.g. SysInternals RegMon
- Typically key names for other software are:
  - Settings, MRU, Recent, Opened, ...

# Last opened application

- HKCU\Software\Microsoft\Windows\CurrentVersion\Explorer\ComDlg32\LastVisitedPidMRU (<Vista: LastVisitedMRU)
  - Applications last used to access the files listed in OpenSavePidMRU (OpenSaveMRU)
  - Contains path information as well

# Windows forensic: Recent files

- Entries in "Recent", "Send to", "Start Menu", ...
  - Can prove the existence of files now deleted
    - » Note: Usually not produced on creating or copying files, but only on opening them!
  - Especially useful for removable media, e.g. USB sticks
- Saved on the disk as ".LNK" files, i.e. shortcuts
- These contain a lot of information:
  - File location
  - Type of disk (hard disk, removable media, CD, ...)
  - File attributes, length, ...
  - Icon information
  - MAC times
- May contain additional data
  - Working directory, shell item ID, description, command line arguments, custom icon etc.

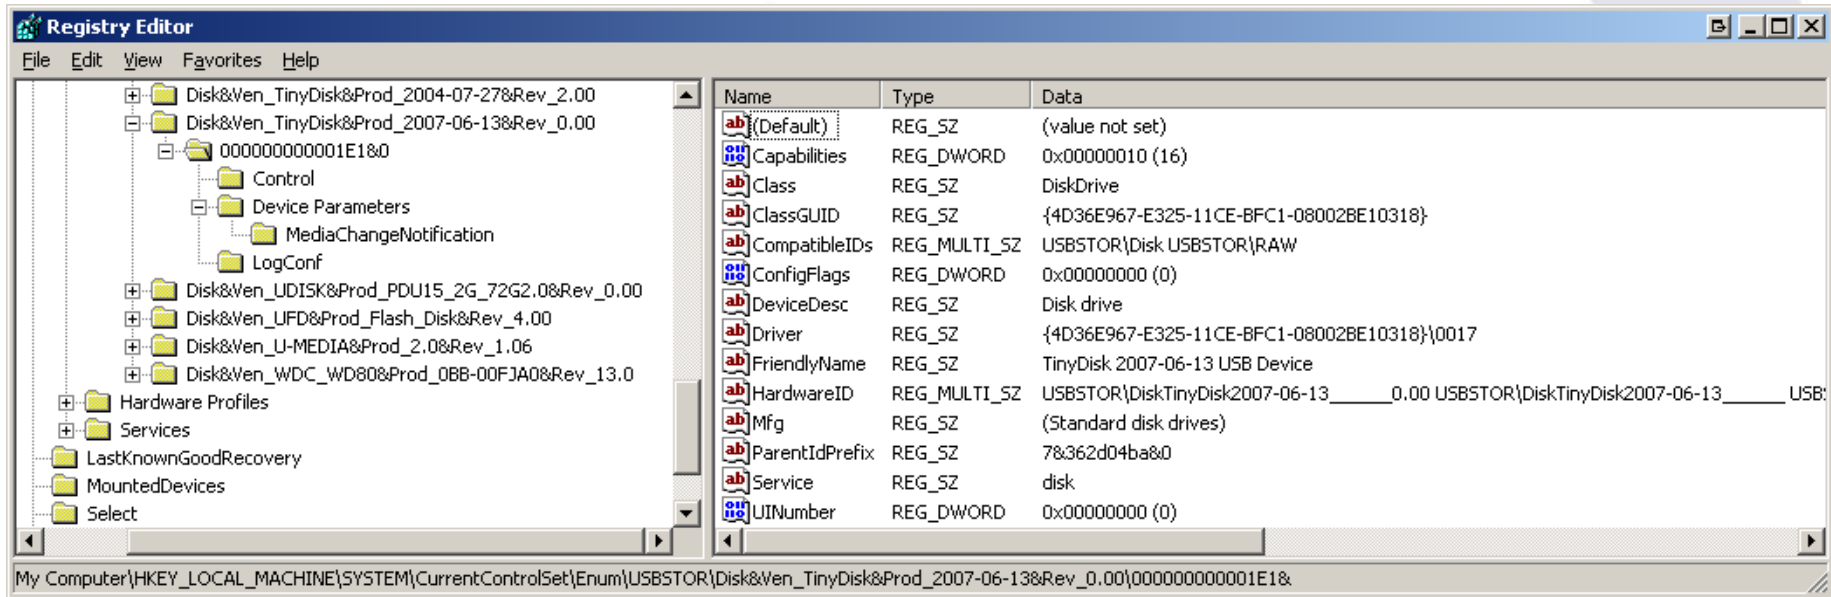

# USB device history

- When a USB device is connected to a computer, this is "logged" within the registry
  - I.e., configured and appropriate driver, if necessary, loaded
  - This information remains when the device is disconnected!
- Note: Most USB storage device have unique serial numbers
  - This means, the exact item can be recognized!
    - » Software: UVCView from Microsoft
- Registry key: HKLM\System\ControlSet00?\Enum\USBSTOR
  - Subkey: Vendor, Producer and Revision
  - Sub-Subkey: Serial number (if existing; else generated)
  - ParentIdPrefix: Corresponds to HKLM\System\MountedDevices
    - » Binary value!
- In C:\Windows\setupapi.log the first installation is logged
- See also software: USBDeview!

# USB device history

- Vendor: TinyDisk (Case label: "extreMEemory USB 2.0 4GB")
- Product: 2007-06-13, Rev. 0.00
- Serial number: 0000000000001E1
- ParentIdPrefix: 7&362d04ba&0
  - HKLM\System\MountedDevices: "\DosDevice\G:"  
\\?\STORAGE#RemovableMedia#7&362d04ba&0&RM#{53f5630d-b6bf-11d0-94f2-00a0c91efb8b}

# USB device history: setupapi.log

## [2007/07/20 11:42:13 840.8 Driver Install]

#-019 Searching for hardware ID(s): usbstor\disktinydisk2007-06-13\_\_\_\_0.00,usbstor\disktinydisk2007-06-13\_\_\_\_,usbstor\disktinydisk,usbstor\tinydisk2007-06-13\_\_\_\_0,tinydisk2007-06-13\_\_\_\_0,usbstor\gendisk,gendisk

#-018 Searching for compatible ID(s): usbstor\disk,usbstor\raw

#-198 Command line processed: C:\WINDOWS\system32\services.exe

#I022 Found "GenDisk" in C:\WINDOWS\inf\disk.inf; Device: "Disk drive"; Driver: "Disk drive"; Provider: "Microsoft"; Mfg: "(Standard disk drives)"; Section name: "disk\_install".

#I023 Actual install section: [disk\_install.NT]. Rank: 0x00000006. Effective driver date: 07/01/2001.

#-166 Device install function: DIF\_SELECTBESTCOMPATDRV.

#I063 Selected driver installs from section [disk\_install] in "c:\windows\inf\disk.inf".

#I320 Class GUID of device remains: {4D36E967-E325-11CE-BFC1-08002BE10318}.

#I060 Set selected driver.

#I058 Selected best compatible driver.

#-166 Device install function: DIF\_INSTALLDEVICEFILES.

#I124 Doing copy-only install of "USBSTOR\DISK&VEN\_TINYDISK&PROD\_2007-06-13&REV\_0.00\000000000001E1&0".

#-166 Device install function: DIF\_REGISTER\_COINSTALLERS.

#I056 Coinstallers registered.

#-166 Device install function: DIF\_INSTALLINTERFACES.

#-011 Installing section [disk\_install.NT.Interfaces] from "c:\windows\inf\disk.inf".

#I054 Interfaces installed.

#-166 Device install function: DIF\_INSTALLDEVICE.

#I123 Doing full install of "USBSTOR\DISK&VEN\_TINYDISK&PROD\_2007-06-13&REV\_0.00\000000000001E1&0".

#I121 Device install of "USBSTOR\DISK&VEN\_TINYDISK&PROD\_2007-06-13&REV\_0.00\000000000001E1&0" finished successfully.

# USB device history

- Last connection:  
HKLM\System\ControlSet00?\Control\DeviceClasses
  - Subkey "{53f56307-b6bf-11d0-94f2-00a0c91efb8b}": Disks
    - » Contains a subkey with the serial number included
  - Subkey "{53f5630d-b6bf-11d0-94f2-00a0c91efb8b}": Volumes
    - » Contains a subkey with the ParentIdPrefix included
  - The LastWrite Time of these keys is the date and time the device was last connected to the computer
- Accessing the LastWrite time:
  - Special tools, or
  - Regedt32: Export as text and open in Notepad
    - Key Name: HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Control\DeviceClasses\{53f56307-b6bf-11d0-94f2-00a0c91efb8b}\##?#USBSTOR#Disk&Ven\_TinyDisk&Prod\_2007-06-13&Rev\_0.00#0000000000001E1&0#{53f56307-b6bf-11d0-94f2-00a0c91efb8b}
    - Class Name: <NO CLASS>
    - Last Write Time: **21.12.2007 - 09:12**
    - Value 0

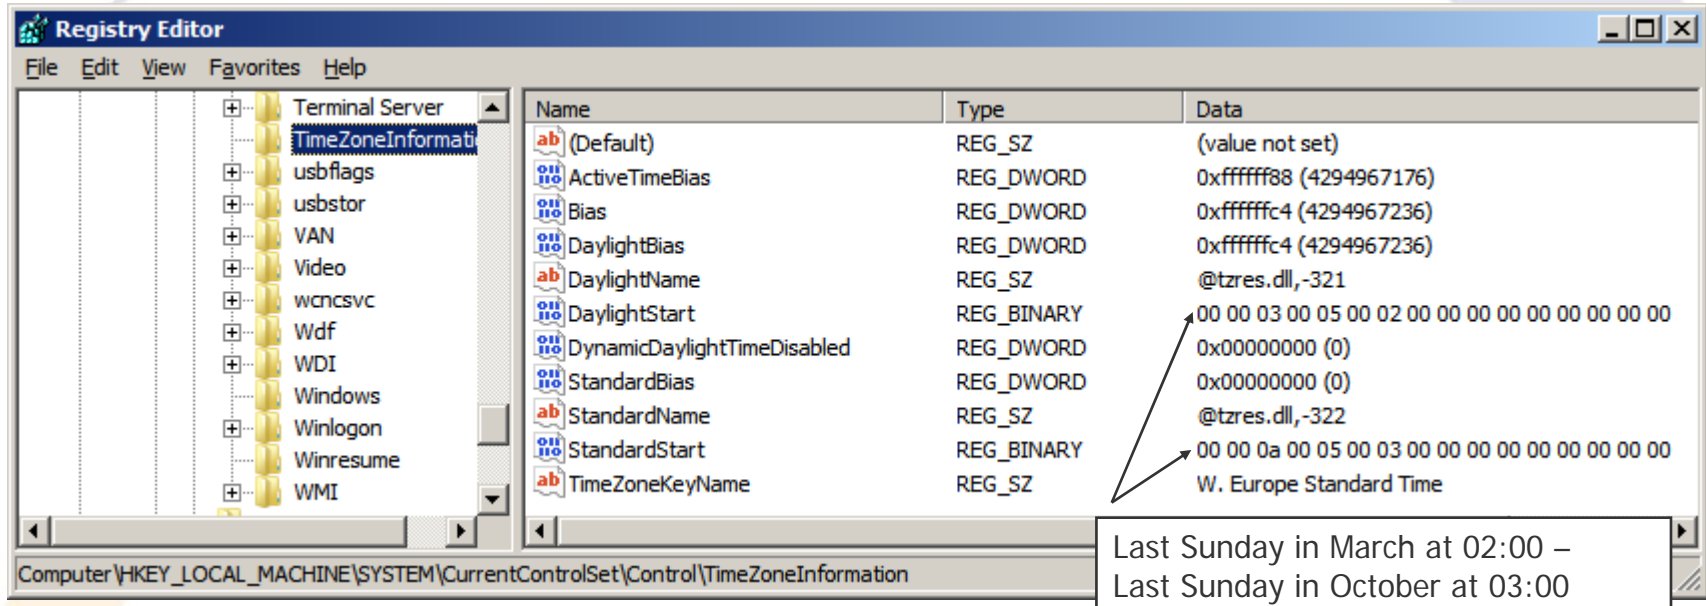

# Registry: Owner information

- Owner/Organization: HKLM\Software\Microsoft\Windows NT\CurrentVersion
  - RegisteredOwner: Owner name
  - RegisteredOrganization: Organization name
  - ProductId: Product ID
  - DigitalProductId: Contains encr. license key (Bytes 52-66)
  - InstallDate: Installation date (UNIX timestamp)
  - SystemRoot: Windows installation directory
- Last user: HKLM\Software\Microsoft\Windows NT\CurrentVersion\Winlogon
  - DefaultUserName: Last logged in user
    - » When? → Timestamp of key!
  - DefaultDomainName: Last domain logged into
  - DontDisplayLastUserName: Don't store information above

<http://www.dagondesign.com/articles/windows-xp-product-key-recovery/>  
<http://geekswithblogs.net/willemf/archive/2006/04/23/76125.aspx>

# Registry: Timezone information

- Data from HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Time Zones is copied here
  - ActiveTimeBias: Current  $\Delta$  (0xffffffff88 = -120 = 2 h E of GMT)
  - DaylightBias: Delta during DST (= -60 = 1 h East of GMT)
  - Daylight-/StandardStart: Should be SYSTEMTIME structure
    - » Year, Month (1=Jan), Day of week (0=Sun), Week (5=last), Hour, Min, Sec, ms (two bytes each); (doesn't match above!)

- "My Network Shares": List of shares within the LAN  
HKCU\Software\Microsoft\Windows\Current Version\Explorer\ComputerDescriptions
  - Allows reconstruction of a past view, i.e. what shares were accessed by the user
  - Contains computers, shares (directories) and printers
  - Value: Name = server/share/printer; Content = Description

- When accessing a WLAN, its SSID is stored:  
HKLM\Software\Microsoft\WZCSVC\Parameters\Interfaces
  - Subkeys look like GUIDs with values for "ActiveSettings", "Static#000?", ...
  - The values for "#Static000?" contain the SSIDs at offset 0x14
- IP address information for this connection (last only):  
HKLM\System\ControlSet00?\Services\Tcpip\Parameters\Interfaces
  - Look for the same "GUID" key as of the WLAN!
  - Dhcp\*: Data on DHCP server, assigned address, netmask, default gateway, domain, nameservers, ...
  - LeaseObtainedTime/-TerminatesTime: Unix 23 Bit Timestamp
    - » When the Address was received and what is the definite last time it could have been used (but not: **was** used!)

- Every single registry **key** has a "LastWrite" time value
  - Does **NOT** exist for registry **values**!
  - Format: FILETIME
  - Updated, when a registry value directly within this key is created, modified, or deleted
- Win2K and WinXP registry editors are flawed
  - » Regedit.exe, regedt32.exe
  - Registry values with a name length of 256-259 characters are not shown
    - » Values afterwards are suppressed as well
    - » Subkeys are inaccessible too
  - But "reg.exe", the console registry tool, **can** show (and manipulate) such values!

<http://search.cpan.org/~adamk/Win32-TieRegistry-0.25/TieRegistry.pm>

- Thinking about shutting down a suspect's computer?
  - First check: HKLM  
System\CurrentControlSet\Control\SessionManager\MemoryManagement\ClearPageFileAtShutdown
    - » Value "1": Paging file **NOT** deleted, but **overwritten** with zeros
- HKLM\System\CurrentControlSet\Control\FileSystem\NtfsDisableLastAccessUpdate
  - Disables writing “last access timestamp” on the file system
    - » Will **still** be changed on file modifications (i.e. writing to it), but not on reading, accessing properties etc.!
- HKEY\_CURRENT\_USER\Software\Microsoft\Protected Storage System Provider
  - Contains IE auto-complete passwords (encrypted)
  - Content not directly accessible, not even with regedt32
  - But can be read in live systems or by parsing the registry file

# Registry: Substitute executed programs

- Allows hiding what programs were ACTUALLY executed!
- HKLM\Software\Microsoft\Windows NT\CurrentVersion\Image File Execution Options
  - Create subkey with name of executable, e.g. "calc.exe"
  - Create string with name "Debugger" and value of alternate program, e.g. "C:\Windows\notepad.exe"
  - Typing "calc.exe" will then start the text editor
    - » With "calc.exe" as parameter
      - or whatever the "original" file was, e.g. a .lnk file!
  - Shows only the "original" program in history lists!
- HKCR\{exe|com|bat}file\shell\open\command
  - Default value contains command to execute ".exe" files
    - » Similar for the explorer context menu:  
HKCR\Drive\shell and HKCR\Folder\shell

# Windows restore points

- Stored under C:\System Volume Information
  - Not accessible through Explorer, but forensic tools!
    - » Not even for the administrator!
      - Deleting a single one is very hard (all/all but last is easy!)
- By default created every 24 hours and retained for 90 days
  - » Registry: HKLM\Software\Microsoft\WindowsNT\CurrentVersion\SystemRestore
  - Also: Manually, before Windows update, SW installation, ...
  - When reverting to a previous point, another restore point is created (to allow going "forward" again)
    - » Restoration is recorded in the system event log (Event ID 110)!
  - Disabling them is possible
    - » Less than 200MB free on system drive → automatically disabled!
- Content:
  - Files to restore (see change.log for original path/filename)
  - Subfolder "snapshot": Registry files (SAM, Security, Software, System, .Default, NTUSER files, USRCLASS files)

- Event logs are normal files
  - Location: Specified in registry (→ to allow relocation)
    - » E.g. security: %SYSTEMROOT%\System32\config\SecEvent.Evt
  - Can be recovered through file carving etc.
  - Fixed size; configurable per log (typ. 512 kB – 16 MB)
- Problem: Security logging is off by default
  - Application and System are on by default
- Format is not officially documented
- Clean shutdown: Offsets of oldest & newest entries written to header and a “clean” flag is set (“dirty” when running)
  - While in use, trailer (after current last entry) has data
  - Common source of corruption in forensics (pulling plug!)
- >=Vista: More kinds of logs (Setup, Administrative tasks, ...)
  - File format changed (\*.evt → \*.evtx): Binary → XML

- Content:
  - Each Event has an EventId, specifying its type
    - » Examples: 528, 540 = Logon, 538 = Logoff
    - » Contains additional details
      - These change with Windows versions → Use same or newer!
  - Timestamp, ...
  - Record number: Used consecutively (→ no record deletion!)
- Inspection possible through windows
  - Or LogParser: Allows SQL-Queries against the log!
    - » And against various other file formats as well
- Reliability: Quite good
  - Modifications are difficult, but not impossible
  - Deleting some elements is very hard
  - But: Deleting the whole log is quite trivial

# Conclusions

- Especially the Registry is a treasure trove of information
  - But the data is very well hidden under obscure names
  - Special attention needs to be paid to how reliable the data is
    - » Windows version, source of description of keys/values etc.!
    - » Try it out on a copy and monitor the changes made
      - E.g. using registry-diff software, sandboxing software
  - Restore points contain previous versions of the registry
- Remnants of activity may remain on the computer for a long time: Recycle bin records, print spool files, event log, ...
  - Sometimes even forever (Thumbs.db) unless expl. removed!
- Restricting the investigation is therefore very desirable
  - Only a subset of data need then be searched for/through!

F I M
